

Astronomical and physical constants

Astronomical unit (AU)	1.4960×10^{11} m
Light year (ly)	9.4605×10^{15} m = 63 240 AU
Parsec (pc)	3.0860×10^{16} m = 206 265 AU
1 Sidereal year	365.2564 solar days
1 Tropical year	365.2422 solar days
1 Calendar year	365.2425 solar days
1 Sidereal day	$23^{\text{h}} 56^{\text{m}} 04^{\text{s}}.091$
1 Solar day	$24^{\text{h}} 03^{\text{m}} 56^{\text{s}}.555$ units of sidereal time
Mass of Earth	5.9736×10^{24} kg
Mean radius of Earth	6.371×10^6 m
Equatorial radius of Earth	6.378×10^6 m
Mean velocity of Earth on its orbit	29.783 km s ⁻¹
Mass of Moon	7.3490×10^{22} kg
Radius of Moon	1.737×10^6 m
Mean Earth – Moon distance	3.844×10^8 m
Mass of Sun	1.98892×10^{30} kg
Radius of Sun	6.96×10^8 m
Effective temperature of the Sun	5780 K
Luminosity of the Sun	3.96×10^{26} J s ⁻¹
Solar constant	1366 W m ⁻²
Brightness of the Sun in V-band	-26.8 mag.
Absolute brightness of the Sun in V-band	4.75 mag.
Absolute bolometric brightness of Sun	4.72 mag.
Angular diameter of the Sun	30'
Speed of light in vacuum (c)	2.9979×10^8 m s ⁻¹
Gravitational constant (G)	6.6738×10^{-11} N m ² kg ⁻²
Boltzmann constant (k)	1.381×10^{-23} m kg s ⁻² K ⁻¹
Stefan–Boltzmann constant (σ)	5.6704×10^{-8} kg s ⁻³ K ⁻⁴
Planck constant (h)	6.6261×10^{-34} J s
Wien's constant (b)	2.8978×10^{-3} m K
Hubble constant (H ₀)	70 km s ⁻¹ Mpc ⁻¹
electron charge (e)	1.602×10^{-19} C
Current inclination of the ecliptic (ε)	$23^{\circ} 26.3'$
Coordinates of the northern ecliptic pole for epoch 2000.0 (α _E , δ _E)	$18^{\text{h}} 00^{\text{m}} 00^{\text{s}}, +66^{\circ} 33.6'$
Coordinates of the northern galactic pole for epoch 2000.0 (α _G , δ _G)	$12^{\text{h}} 51^{\text{m}}, +27^{\circ} 08'$

You can try to solve an equation $x = f(x)$ using iteration: $x_{n+1} = f(x_n)$.

Basic equations of spherical trigonometry

$$\begin{aligned} \sin a \sin B &= \sin b \sin A, \\ \sin a \cos B &= \cos b \sin c - \sin b \cos c \cos A, \\ \cos a &= \cos b \cos c + \sin b \sin c \cos A. \end{aligned}$$

Short theoretical questions

Each question max 10 points

- Most single-appearance comets enter the inner Solar System directly from the Oort Cloud. Estimate how long it takes a comet to make this journey. Assume that in the Oort Cloud, 35 000 AU from the Sun, the comet was at aphelion.
- Estimate the number of stars in a globular cluster of diameter 40 pc, if the escape velocity at the edge of the cluster is 6 km s^{-1} and most of the stars are similar to the Sun.
- On 9 March 2011 the Voyager probe was 116. 406 AU from the Sun and moving at 17.062 km s^{-1} . Determine the type of orbit the probe is on: (a) elliptical, (b) parabolic, or (c) hyperbolic. What is the apparent magnitude of the Sun as seen from Voyager?
- Assuming that Phobos moves around Mars on a perfectly circular orbit in the equatorial plane of the planet, give the length of time Phobos is above the horizon for a point on the Martian equator. Use the following data:
Radius of Mars $R_{\text{Mars}} = 3\,393 \text{ km}$ Rotational period of Mars $T_{\text{Mars}} = 24.623 \text{ h}$. Mass of Mars $M_{\text{Mars}} = 6.421 \times 10^{23} \text{ kg}$ Orbital radius of Phobos $R_{\text{P}} = 9\,380 \text{ km}$.
- What would be the diameter of a radiotelescope working at a wavelength of $\lambda = 1 \text{ cm}$ with the same resolution as an optical telescope of diameter $D = 10 \text{ cm}$?
- Tidal forces result in a torque on the Earth. Assuming that, during the last several hundred million years, both this torque and the length of the sidereal year were constant and had values of $6.0 \times 10^{16} \text{ N m}$ and $3.15 \times 10^7 \text{ s}$ respectively, calculate how many days there were in a year 6.0×10^8 years ago. Moment of inertia of a homogeneous filled sphere of radius R and mass m is $I = \frac{2}{5} m R^2$
- A satellite orbits the Earth on a circular orbit. The initial momentum of the satellite is given by the vector \mathbf{p} . At a certain time, an explosive charge is set off which gives the satellite an additional impulse $\Delta\mathbf{p}$, equal in magnitude to $|\mathbf{p}|$. Let α be the angle between the vectors \mathbf{p} and $\Delta\mathbf{p}$, and β between the radius vector of the satellite and the vector $\Delta\mathbf{p}$. By thinking about the direction of the additional impulse $\Delta\mathbf{p}$, consider if it is possible to change the orbit to each of the cases given below. If it is possible mark YES on the answer sheet and give values of α and β for which it is possible. If the orbit is not possible, mark NO.
 - a hyperbola with perigee at the location of the explosion.

- (b) a parabola with perigee at the location of the explosion.
- (c) an ellipse with perigee at the location of the explosion.
- (d) a circle.
- (e) an ellipse with apogee at the location of the explosion.

Note that for $\alpha = 180^\circ$ and $\beta = 90^\circ$ the new orbit will be a line along which the satellite will free fall vertically towards the centre of the Earth.

8. Assuming that dust grains are black bodies, determine the diameter of a spherical dust grain which can remain at 1 AU from the Sun in equilibrium between the radiation pressure and gravitational attraction of the Sun. Take the density of the dust grain to be $\rho = 10^3 \text{ kg m}^{-3}$.
9. Interstellar distances are large compared to the sizes of stars. Thus, stellar clusters and galaxies which do not contain diffuse matter essentially do not obscure objects behind them. Estimate what proportion of the sky is obscured by stars when we look in the direction of a galaxy of surface brightness $\mu = 18.0 \text{ mag arcsec}^{-2}$. Assume that the galaxy consists of stars similar to the Sun.
10. Estimate the minimum energy a proton would need to penetrate the Earth's magnetosphere. Assume that the initial penetration is perpendicular to a belt of constant magnetic field $30 \mu\text{T}$ and thickness $1.0 \times 10^4 \text{ km}$. Prepare the sketch of the particle trajectory. (Note that at such high energies the momentum can be replaced by the expression E/c . Ignore any radiative effects).
11. Based on the spectrum of a galaxy with redshift $z = 6.03$ it was determined that the age of the stars in the galaxy is from 560 to 600 million years. At what z did the epoch of star formation occur in this galaxy? Assume that the current age of the Universe is $t_0 = 13.7 \times 10^9$ years and that the rate of expansion of the Universe is given by a flat cosmological model with cosmological constant $\Lambda = 0$. (In such a model the scale factor $R \propto t^{2/3}$, where t is the time since the Big Bang.)
12. Due to the precession of the Earth's axis, the region of sky visible from a location with fixed geographical coordinates changes with time. Is it possible that, at some point in time, Sirius will not rise as seen from Krakow, while Canopus will rise and set? Assume that the Earth's axis traces out a cone of angle 47° . Krakow is at latitude 50.1° N ; the current equatorial coordinates (right ascension and declination) of these stars are:

Sirius ($\alpha \text{ CMa}$) :	$6^{\text{h}} 45^{\text{m}}$,	$-16^\circ 43'$
Canopus ($\alpha \text{ Car}$) :	$6^{\text{h}} 24^{\text{m}}$,	$-52^\circ 42'$
13. The equation of the ecliptic in equatorial coordinates (α, δ) has the form:

$$\delta = \arctan (\sin \alpha \tan \varepsilon),$$
 where ε is the angle of the celestial equator to the ecliptic plane. Find an analogous relation $h = f(A)$ for the galactic equator in horizontal coordinates (A, h) for an observer at latitude $\varphi = 49^\circ 34'$ at local sidereal time $\theta = 0^{\text{h}} 51^{\text{m}}$.

14. Estimate the number of solar neutrinos which should pass through a 1 m^2 area of the Earth's surface perpendicular to the Sun every second. Use the fact that each fusion reaction in the Sun produces 26.8 MeV of energy and 2 neutrinos.
15. Given that the cosmic background radiation has the spectrum of a black body throughout the evolution of the Universe, determine how its temperature changes with redshift z . In particular, give the temperature of the background radiation at the epoch $z \approx 10$ (that of the farthest currently observed objects). The current temperature of the cosmic background radiation is 2.73 K .
